EDUCATION

Dayananda Sagar University Bengaluru, India
B.E in Computer Science and Engineering **Dec 2022 - July 2026**

SKILLS SUMMARY

- **Languages**: Python, JAVA, C,HTML,CSS(Basic)
- **Frameworks**: Pandas, NumPy, Matplotlib.
- **Tools**: , Excel, PowerPoint, MySQL
- **Platforms**: Programiz, Jupyter Notebook, Visual Studio Code.
- **DataBases**: MongoDB.
- **Soft Skills**: Effective Communication, Strong Stakeholder management, People Management, Adaptability

PROJECTS

Machine Learning-Based Environmental Analysis for Crop Recommendation (Major Project)

- Designed and implemented an intelligent crop selection system based on Machine Learning and IoT sensors to enable farmers to select crops depending on the existing soil and weather conditions.
- Used integrated pH, temperature, humidity, and NPK sensors with an Arduino Nano through RS-485 communication to securely send data over long distances to a host computer.
- Created a Python program to obtain sensor values, process it, and apply a Random Forest Classifier model trained on historical agriculture data to predict the optimal crops.
- Achieved 94.77% prediction accuracy and ensured the proper functioning of the system by using backup values for missing information. Real-time recommendations were displayed on an OLED screen for field use.

VoltRescue – Power When You Need Platform (Minor Project)

- Created VoltRescue, a two-interface Flutter consumer and service provider application. Stranded electric vehicle users are helped through real-time EV charging support through location-based service requests.
- Created login and home screens for both kinds of users with two different methods of accessing the app (`main_customer. dart` and `main_provider. dart`) so both have their own interfaces and processes.
- Implement live location sharing and tracking using `flutter_map` and OpenStreetMap and Firebase Firestore. This enables providers to view customer locations when requested and customers to track providers when service is booked.

Attendance Detection Using RFID (Minor Project)

- Developed and implemented an RFID-based system for automating and easing student attendance tracking in schools.
- Applied RFID readers and tags with Arduino/microcontroller, which were linked to a real-time logging backend database.
- Provided a standard base user interface to access attendance records, with accurate and tamper-evident monitoring that required minimal manual intervention.

CERTIFICATES

Data Analysis Concepts

- Built a strong foundation in data cleaning, visualization, and basic statistical techniques for effective data-driven decision-making.

Python Programming

- Gained hands-on experience in data cleaning, visualization, and basic statistical analysis using libraries like Pandas, Matplotlib, and Seaborn for effective data-driven decision-making.

Internship On Artificial Intelligence

- Completed an internship focused on core Artificial Intelligence and Machine Learning techniques, gaining practical exposure to real-world applications.
